Interview with Mr. L (2024 June 29th)

The interview has been shortened/summarized at some points to reduce information irrelevant to the product that was spoken during the interview

Interview with Mr. L, client (L), by developer (M).

M: Hi, thanks for your time.

L: Yeah no problem.

M: Can I just ask, so which phone do you use more often?

L: I mean I sold my Pixel.

M: Oh. And what's your iPhone again?

L: iPhone 15 Pro

M: Okay noted. So why do you want a new ledger app?

L: You know how a lot of expense trackers don't really take into account that you're using a card, and I just want to be able to know how much I spent on each card that I own right now. So like it'd be nice to be able to track the amount I spent per card instead of just like per category or month.

M: Sure.

L: And well I don't know if you can do this but also since I also have like yen on some of my cards right, I also need to take that into account.

M: So like convert the currencies?

L: Yeah something like that. Like if you could use the exchange rate from the day.

...

L: Oh you know what would also be nice?

M: What?

L: If I could see the points I'm earning from each time I spend. Like separate the expected cash back rate from the transaction and tie it to the card so I can see it.

M: Noted.

...

M: Do you like prefer graphs to look at or...

L: Yeah I mean if it's not too hard you could make a pie chart or something like that.

M: Yeah I think I can do that.

L: But like I want to also be able to just read the numbers of course.

M: Yes of course.

L: So I need to be able to see the total of the month for each card, and like per category might be good to put into a graph. That, and also the cashback thing.

...

[End of interview]

Dear

Here is my feedback after trying your application.

Criteria #1: The application allows users to create different cards under their account, assigning details such as name, default currency, cashback rate, etc.

- This function was clearly implemented in the app, and the ability to customize the card design is nice and aesthetically pleasing.

- It's fine as it is, but it would be nice if I could add notes to cards like it is possible for expenses.

- If you try to create an expense without having created a card, the app crashes. Further user input validation is needed.

Criteria met

Criteria #2: The application allows users to input customized expenses, being able to select the date, card used, the category of the transaction, and the currency used.

- This was especially clear as I could access it from the navigation bar. Typing and selecting data straightforward.

- It was difficult at first to determine where I could add new categories and currencies. It would be more convenient if it were possible to create new categories and currencies from the new expense screen.

- "Uncategorized" as default category makes sense, but ability to set own custom default category would be nicer.

- Unexpected inputs are only partially handled for currencies? It is still possible to select an unknown currency for an expense which causes crash. May be better to prevent adding non-valid currency altogether.

Criteria met

Criteria #3: The application allows for expenses to be deleted and edited.

- Editing the expense was clear and intuitive, and details are updated as they should be.

- Although this was implemented, it was difficult to tell how to delete expenses (like the long press). Instructions are necessary.

- Confirmation dialog is implemented for feedback after user action.

Criteria met

Criteria #4: The application can display cumulative statistics (e.g. total expenditures, total expected cashback) of expenses by card, and by month.

- Total and cashback implemented for each card.

- It seems only total expenditure is implemented for the cumulative by month?

- Additionally would benefit from formatting all numbers (e.g. calculated amounts after currency exchanged, cashback) to the same number of decimal places

Partially met

Criteria #5: The application can display pie charts of a breakdown of expenses by category from cumulative and per-card monthly expenditures.

- Was seen in application, correct filtering by month, looks good.

- Could be interactive, right now totals for each category are read off of the key underneath, but being able to touch the pie chart for example for more details could be better.

Criteria met

Criteria #6: If an expense is made in a non-default currency, the application obtains the exchange rate between two given currencies on the day of transaction to convert the currency.

- Was seen, conversion rate seems to be different for each day. (It looks correct)

- Would prefer that currency be converted into the default currency of the used card, instead of the default currency for the system.

- Again, the numbers are formatted to less significant figures for some screens and not for others

Criteria met

Overall, the necessary functions (success criteria) are met in the application you created. While outside the success criteria, there are still some improvements that could be made, especially in regards to preventing crashes by implementing more user-input validation.

- Deleting currencies and categories causes crashes.

- It is possible to create an expense before creating a card, causing a crash.

- It is possible to select "unknown" currencies for expenses and cards, causing a crash.

- Exchanged currency and monthly cashback is not formatted to 2 decimal places.

- Navigating UI is not intuitive at the beginning, especially when everything is blank.

I think that the app is a good start that gets everything that I requested done, and therefore I'm looking forward to even more improvements in the future.

Sincerely,
